

The nonstick doubly reinforced to outlast all conventional nonsticks

Quantum2 was developed to outlast all conventional nonstick coatings (even the most dramatically improved versions).

What makes it so much better?

- Quantum2 is reinforced with a diverse blend of super-tough, space-age inorganic particles.

- It's reinforced in both the primer and the midcoat.
- The fluoropolymers are altered to blend with the other elements in the coating to achieve maximum durability.
- Yet the nonstick surface is smoother, with higher, eye-catching gloss than conventional nonsticks.
